

Meta Worth

A platform that enables meta creators to easily manage their metadata, media files, and tracking their NFT assets trading history all-in-one place

Victor Feng

Status Quo

Manually maintain metadata in word, google docs or other text tools

- There is not an application to manage metadata, upload files to IPFS/Filecoin, and mint the metadata across of blockchains for the meta creators.
- Copy paste the prepared metadata to marketplace to mint the NFT, it's a huge amount of workload if the serial of NFT has hundreds and thousands unique items.
- If the creators lost their private keys, then they are gonna need to re-create a new collection and re-mint manually by themselves, it's pretty error prone.
- The creator need to use different third party's services to tracking their NFTs listed on different marketplaces.

Our Solutions

A decentralized one-stop-shop data manager for meta creators

- All features are built on top of Rarible Protocol by using @raribles' JS SDK.
- The data stores on IPFS/Filecoin nodes, which means everyone can access that data at anywhere, anytime, and forever.
- The meta creators can create and deploy the NFT smart contracts onto any blockchain networks they would like.
- The meta creators can track their NFT trading history including owners, prices, and when etc.

THANK YOU!
